

Optimisation Report

Introduction

Brief overview of Foodstuffs problem, minimisation goal for delivery cost.

Data Exploration/ Demand Estimation

Description of given dataset. Explanation of how we came up with our demand estimation, handling of outliers.

Route Generation and LP

Formulate the LP, description of objectives, constraints, etc. Present the optimal schedule with a cost breakdown and number of routes per day. Talk about the shedding vs no shedding variants.

Visualisation of Proposed Routes

Present our generated maps/visualisations, showing store locations, route groupings, and which stores are shed for the shedding variants.

Simulation

Describe the simulation framework, detailed explanation on how we came up with traffic and demand variation methods. Present results.

Wider Implications

Discuss broader impact on store staff, customers, supply chain, etc. Consider effects on stores that are regularly shed/skipped.

Recommendation

Final recommendation on which strategy to adopt, suggest possible improvements, and next steps.

Conclusion (?)

Final summary (?)
